

Introducing .....

# StockPack

The Coolstore / Inventory Control and Shipping program.

Stockpack is a designed to accept stock from packhouses, coolstores or traders. The stock can then be placed in an order and loaded out easily. Stockpack uses a unique graphical interface to make this possible. Its users deal with items on screen as they would do if handling the real product. Helping to pick and handle the stock is a advanced system of filtering that allows the user to work with only the stock he wants to see and that are relevant to the current transaction.

Stockpack also uses the common TASC “Datapack” reporting program. This means a variety of user designed reports can be generated. If LabelPal is also being used within the facility as well, the user only has to learn reporting once.

Within StockPack pallets of produce can be moved, attributes changed, individual cartons added or removed just as in real life. Additional information such as shipping details, buyer reference information etc can be associated with the product as it passes through the facility.
